EXOBIOLOGY - ALIEN ANIMAL - ENERGETIC LARVAE - EXTRATERRESTRIAL CONTACT
Published 22 May 2021 by Pleiadian Knowledge, Cristina & Estella

Cristina: Is the name of Alien's animal (Lurker) Taygetean?

Anéeka of Temmer: No, it's a name given by humans from the Alien movies, possibly from James Cameroon. It has many names here, but I don't know how to write them. Essentially it called bug, or nefarious insectoid bug.

Cristina: Is it the same as the one in the movie? I think you said that it did not have a human body but a kind of insect body. Does it also have two mouths?

Anéeka of Temmer: The body, the tail and the claws are from the same animal. What changes is that it is too humanoid in the movie. But keep in mind that in the movie it is supposed to take the bodily form of the host from which it came. So, it's a justification for the movie to make it look humanoid. Ok, valid in the cinema. But up here it's always the same bug, with an insectoid body.

Pictures not supported

The head is correct, with everything and the double set of teeth. Claws, tail and general color also good. The blood acid thing, partly correct. And the correct color, although all black would also be correct. (I've never seen one up close, only in computer data.)

Another thing is that there are thousands and thousands of species of variants of that creature and of various sizes. All scattered on planets that are usually quite hostile to life as we see it or need it ourselves.

Estel·la: Do you know anyone who has seen one up close or some story like that of facing one?

Anéeka of Temmer: No. We know that they exist and that they are quite common and a constant danger. But here no one has told me nor is it said that they have been seen here.

Cristina: And the body of an insect… What kind of insect?

Anéeka of Temmer: It is very thin but not that long. Some with multiple legs not just 2 or 4. They do not usually have an insect abdomen, but some species do. (Or queens if they have it). In themselves, they are classified as that, insectoids.

Cristina: Are there any insects here that have a similar body?

Anéeka of Temmer: Yes, arachnids of the flat type.

Cristina: Would the body be like this spider?

Pictures not supported

Anéeka of Temmer: Yes, only longer, without protruding abdomens, only queens.

Cristina: And how does it get around? Like a quadruped?

Anéeka of Temmer: Yes, as a quadruped or as a multipedal. They do not walk on two legs.

Cristina: And the tail? How is it?

Anéeka of Temmer: Like in the movies. Long with segments and a spike as a weapon at the tip and they also use it a lot. And like in the movies, extremely smart for their purposes.
Claws on its legs, the one with 4 legs is the one that most resembles the one in the cinema. And segmented body with natural exoskeleton.

Estel·la: How big is the Lurker or the nefarious insectoid bug?

Anéeka of Temmer: They exist in all sizes, even very small, but the one that most closely resembles the one in the movie can be around 10 feet tall if it stands on its back legs.
All highly carnivorous.

Estel·la: So it's like a scorpion, right?

Anéeka of Temmer: Yes, but the scorpion has a different shape at the front and the shape or relationship between the dimension of its body changes a bit, but yes you're right, it could be related to scorpions, which I understand are also arachnids.

Estel·la: Thank you, I understand.

Cristina: And another question about the Lurker… And how is it about acid blood? I think it has acid saliva in the movie too.

Anéeka of Temmer: I don't have corroborating information about the saliva. But the blood is acidic, very acidic. But I think it is not as acidic as in the movie. I cannot confirm. I do not have the data now.

But they focus their dangerousness more towards their abilities to bite, scratch and solve problems. They are known to have extraordinary strength, like any good insect.

Cristina: And how do they reproduce? Is it like in the movie? Do they also need a host?

Anéeka of Temmer: Like in the movie, yes. And they devastate entire places of fauna for that reason and for food. They destroy the ecosystem and then go into torpor waiting for more victims to come to them, and they can stay that way almost indefinitely.

Horrible, I know! In space, there is everything. From beings of light of very high densities that do not need ships and that only appear as "someone" to interact with other people of levels below. To even the most dire creatures of low evolutionary level you can imagine, and everything in between.

Cristina: And what planet or planets does it originate from?

Anéeka of Temmer: It is not known. They are a very ancient species and are everywhere that their biology supports. And as in the film, great efforts are made to prevent their spread and contamination to planets that do not have them.

Not only because of these, but also because of predators in general, Erra and Temmer can be very vulnerable ecosystems to the introduction of alien species. The animals don't know about predators in many

places.

For example, in Temmer countless species of birds nest directly on the ground, both in forests and on beaches or among reeds and plants on the shores of lakes.

Cristina: Of course I understand, they are a threat to any ecosystem!

Anéeka of Temmer: Yes. But for example, we cannot introduce predator species to these vulnerable ecosystems. Even if they are not like this, that is, a dog for example.
(The domestic cat is already integrated into most of these ecosystems in Erra and Temmer)

Domestic cats tend to leave birds and their chicks of certain species alone. Although in theory they could eat them, it seems that they are even afraid of them.

Cristina: And what planets or what type of climate or biology is suitable for these animals?

Anéeka of Temmer: Lurker adapts to any climate, any extreme condition. But they are known to be more abundant in very hot and humid places or planets.

Cristina: How tough!!! And is this animal carbon-based or silicon-based?

Anéeka of Temmer: It seems that I understood that it was silicon, but according to the last thing they told me recently, it is a hybrid of the best of both worlds, that's why it eats meat, if it did not have a carbon element, they could not eat meat. That makes it even more dangerous, because it adapts to any condition and diet. In addition, its exoskeleton protects it as an armor.

Cristina: I didn't know that silicon-based animals couldn't eat meat…

Anéeka of Temmer: Yes, it's that carbon nourishes carbon and silicon nourishes silicon. It is basically mineral. It is useless to eat meat if it does not nourish a silicon body. That does not mean that it is not dangerous or also kills a silicon-based animal. But this one is between the two worlds.

Cristina: Thanks how interesting, and how is a silicon animal? What characteristics does it have? How are carbon-based different from silicon-based?

Anéeka of Temmer: Silicon-based ones are very Insectoid in appearance. That's a constant with silicon ones. Also using exoskeleton.

Pictures not supported

Regarding the silicon and carbon hybridization, I am sure that the silicon part is concentrated in the exoskeleton armor and other parts such as teeth. With a carbon interior and organs.

Cristina: Thank you Anéeka, how interesting!

Estel·la: And how does the cabal have so much information about this animal?

Anéeka of Temmer: It is one of the animals outside Earth best known for its high danger.
This kind of information is held by the Cabal because monopolizes ancient texts that are from Atlantis or earlier. This is known because they took the library of Alexandria among others. Burning only the copies.

Even the books that are antagonistic to them, that contradict them, take copies of them, and put them under the Vatican, because information is power. They are not going to destroy something that can then be used for planetary control. Or in case another copy comes out that they have not yet destroyed and want to see what it contains.

And it is also known that they have never stopped communicating with races of the Federation throughout the centuries. That is, deep secret societies have always had contact with beings from other worlds. The world does not work as you are told.

Cristina: So, the lurker has never been on Earth, has it?

Anéeka of Temmer: Not that I know of.

Estel·la: Did you learn about this bug at the Academy?

Anéeka of Temmer: Yes, it is essential to know about this bug, identify it and not interact with it in any way. Also, a long list of troublesome species that are on various worlds. Not just this nefarious bug. Plants included.

Estel·la: Is this the top 1 in dangerousness? Or are there others above?

Anéeka of Temmer: In its class is 10 out of 10 dangerous. I say in its class because there are others who are like internal parasites that eat the victim from the inside and are difficult to detect, for example. That's 10 out of 10 too, but of a different kind.

Some can be mimicked with shapes of the same organs, passing through tissue of the same body, as fat cells or as cysts. So even with equipment you don't detect them, just because you see the effects and symptoms. It is said that it is as if they go to another density so as not to be detected, and they return to yours to eat you inside and then they go to the other density again.

How can one get rid of this? What a nefarious energetic larva!

Cristina: And in this case, how do you remove them?

Anéeka of Temmer: By Medical pod only. It is the safest way. Only your biology remains. And it handles frequencies too, so it handles or cleans your etheric implants, if necessary. The things is that you feed them with your thoughts, being or remaining as compatible with your frequencies, so those bugs adhere to your aura. And from there they drain your energy.

Pictures not supported

But if you are in suspended animation in the Medical Pod, your thoughts are very high density. While you are in recovery, in dreams. And the energetic larvae come off because you are no longer interesting to them.

But those are the energetics ones, that are common in 3D, being 4D beings. In 5D there are still some, but not so many. They are just interdimensional animals and parasites. They consume your vital energy.

The point is that some do consume your physical body from the inside like a normal parasite. But very strongly. They end up or may end up killing the host due to internal bleeding and organ failure for multiple

reasons.

Estel·la: It’s horrible! But very interesting this about med pod!

Anéeka of Temmer: Yes, that’s why the Medical Pod is the most used instrument in health matters here, because of its multifunctional capacity and because they are very safe. In many cases, the healing process can be interrupted at any point. And without complications. But not in all cases it can be interrupted, of course.

For example, in the case of a restoration or regeneration of a lost or amputated limb, the process cannot be stopped midway. Or progress would be lost.

Estel·la: Aha I understand, the pods are very needed here.

Anéeka of Temmer: I know.
